CPU Clock

The clock determines the pace of this cycle

- Speed Measured in Hz (Cycles per second)
- Faster = Faster Computer

Overclocking is literally just speeding up the CPU clock!

Microsoft Visual Studio Debu

Interrupts

Keyboard Interrupts

Interrupt the current runtime of your program to get what the keyboard is saying

- Literally Halts the CPU's cycle
- Return to the previous execution after the keypress process
- Can be used to control the program

Unfortunately, your OS handles this, not you. C++ simply cannot control this without OS specific packages

Windows Read Keyboard

```
#include <windows.h>
```

```
if (GetKeyState(VK_MENU) & 0x8000) { /*ALT key is down*/ }
```

```
// You'll need to lookup your keycodes
```

```
// This isn't reading interrupts (Windows requires you have a  
window open to do that, and the console doesn't count)
```

```
if (GetAsyncKeyState(VK_SPACE) & 0x8000) { /*Spacebar*/ }
```

```
// Stores keypresses longer
```

```
C:\Users\brend\source\repos\VGATestProject\x64\Release\VGATestProject.exe (process 70484) exited with code 0.  
Press any key to close this window . . .
```

Linux Read Keyboard

```
#include <ncurses.h>
```

```
initscr(); raw(); noecho();
```

```
int inputCode = getch();
```

```
if (inputCode == 32) { /*SPACE Pressed*/ }
```

```
endwin();
```

```
// Honestly, IDK if this works, but this was the most common  
answer online
```

Assignment

Microsoft Visual Studio Debu

Create Controls for your Video Player

Have SPACE pause your animation and ESC exit your program.

I will walk you through this process in class!
